

# **Monolithic IF Amplifier**

The MC1350 is an integrated circuit featuring wide range AGC for use as an IF amplifier in radio and TV over an operating temperature range of  $0^{\circ}$  to +75°C.

Power Gain: 50 dB Typ at 45 MHZ
 50 dB Typ at 58 MHZ

• AGC Range: 60 dB Min, DC to 45 MHz

• Nearly Constant Input & Output Admittance over the Entire AGC Range

• Y21 Constant ( −3.0 dB) to 90 MHz

• Low Reverse Transfer Admittance: < < 1.0 μmho Typ

• 12 V Operation, Single-Polarity Power Supply

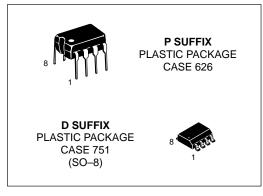

# **MAXIMUM RATINGS** ( $T_A = +25^{\circ}C$ , unless otherwise noted.)

#### **GENERAL OPERATING INFORMATION**

The input amplifiers (Q1 and Q2) operate at constant emitter currents so that input impedance remains independent of AGC action. Input signals may be applied single—ended or differentially (for ac) with identical results. Terminals 4 and 6 may be driven from a transformer, but a dc path from either terminal to ground is not permitted.

Figure 4. Circuit Schematic

AGC action occurs as a result of an increasing voltage on the base of Q4 and Q5 causing these transistors to conduct more heavily thereby shunting signal current from the interstage amplifiers Q3 and Q6. The output amplifiers are supplied from an active current source to maintain constant quiescent bias thereby holding output admittance nearly constant. Collector voltage for the output amplifier must be supplied through a center–tapped tuning coil to Pins 1 and 8. The 12 V supply (V+) at Pin 2 may be used for this purpose, but output admittance remains more nearly constant if a separate 15 V supply (V+ +) is used, because the base voltage on the output amplifier varies with AGC bias.

Figure 5. Frequency Response Curve (45 MHz and 58 MHz)
