DESCRIPTION

The TURBOSWITCH is a very high performance series of ultra-fast high voltage power diodes. TURBOSWITCH family drastically cuts losses in both the diode and the associated switching IGBT and MOSFET in all freewheel mode operations and is particularly suitable and efficient in motor

control freewheel applications and in booster diode applications in power factor control circuitries.

Available either in SMB or DO-15 axial package, these 600V devices are particularly intended for use on 240V domestic mains.

APPLICATION DATA

The TURBOSWITCH™ is especially designed to provide the lowest overall power losses in any “Freewheel Mode” application (see fig. A) considering both diode and companion transistor, thus optimizing the overall performance in the end application.

The way of calculating the power losses is given below :

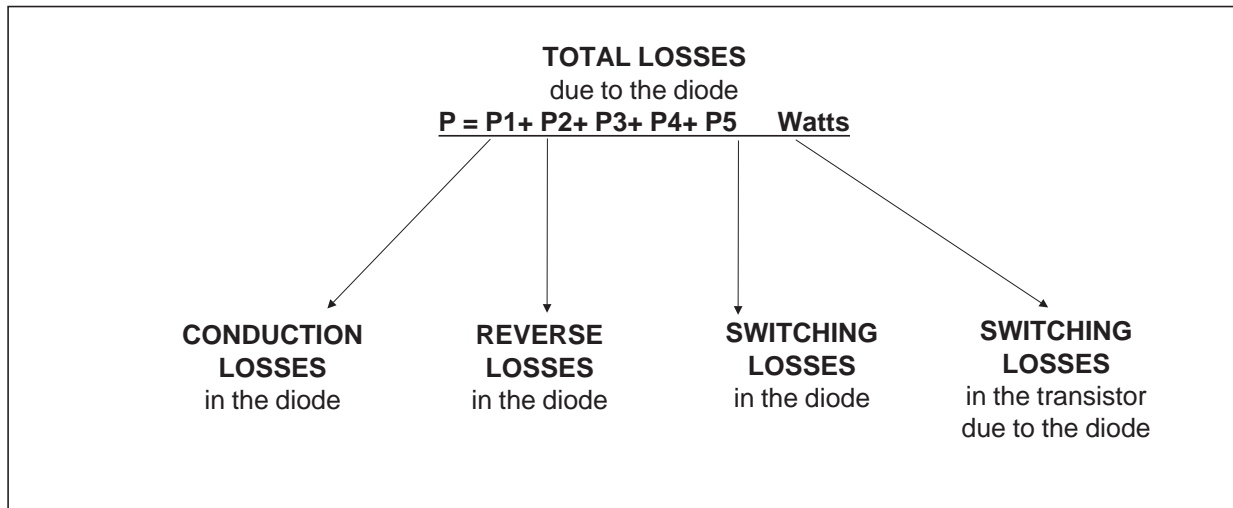

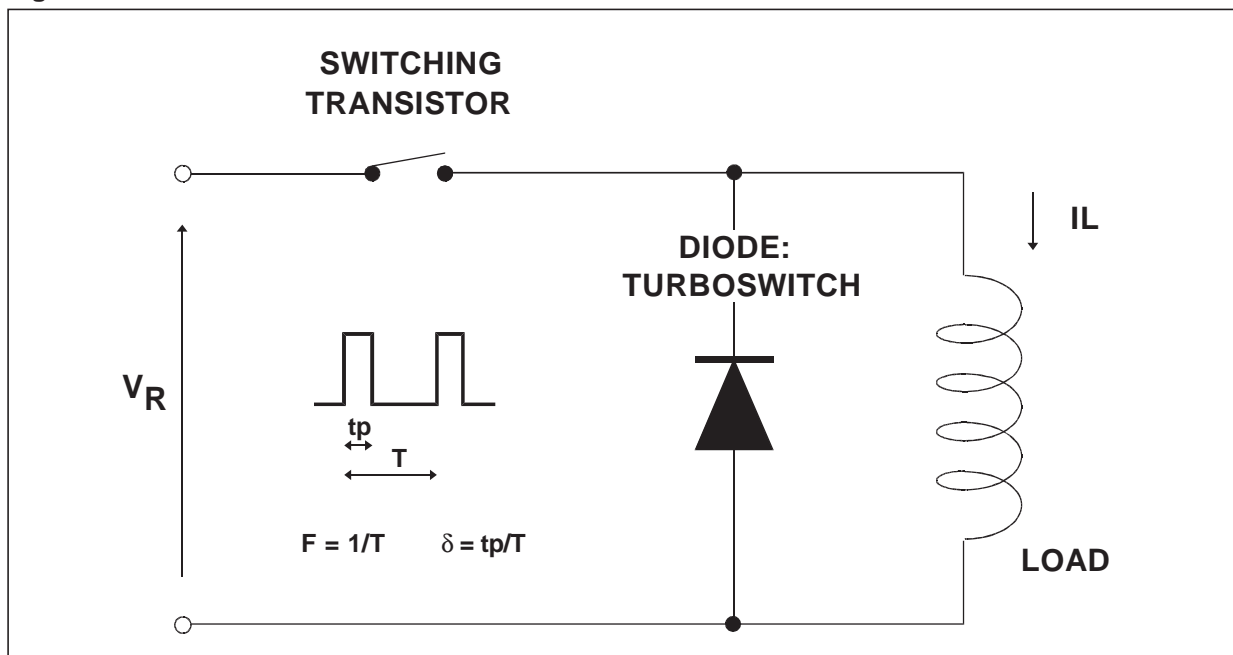

Fig. A : “FREEWHEEL” MODE

APPLICATION DATA (Cont'd)

Fig. B : STATIC CHARACTERISTICS

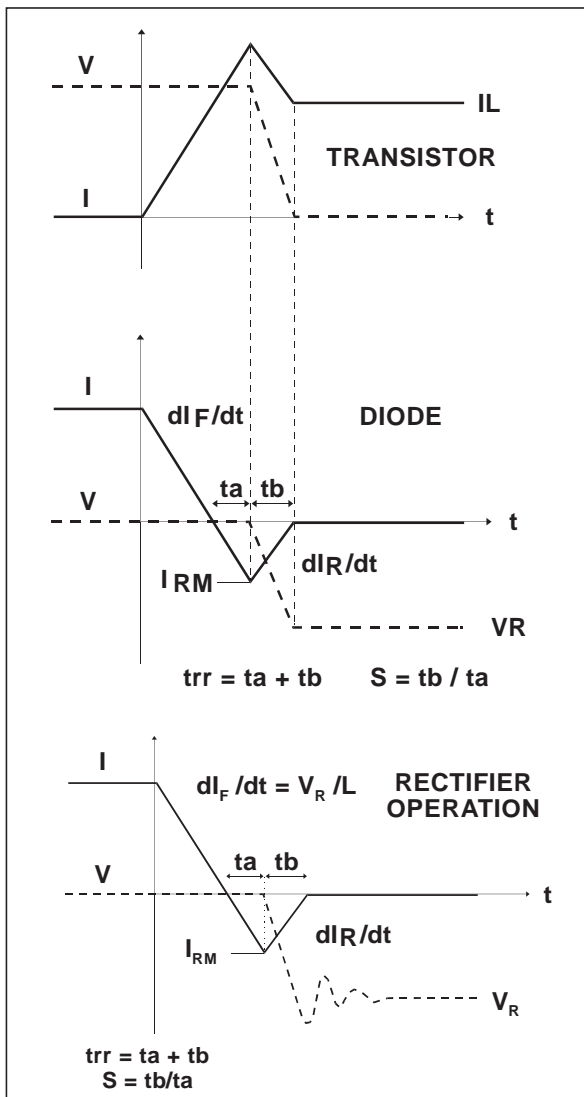

Conduction losses :

$$P1 = V_{to} \times I_F(AV) + R_d \times I_F^2(RMS)$$

Reverse losses :

$$P2 = V_R \times I_R \times (1 - \delta)$$

Fig. C : TURN-OFF CHARACTERISTICS

Turn-on losses :

(in the transistor, due to the diode)

$$P5 = \frac{V_R \times I_{RM}^2 \times (3 + 2 \times S) \times F}{6 \times dI_F/dt} + \frac{V_R \times I_{RM} \times I_L \times (S + 2) \times F}{2 \times dI_F/dt}$$

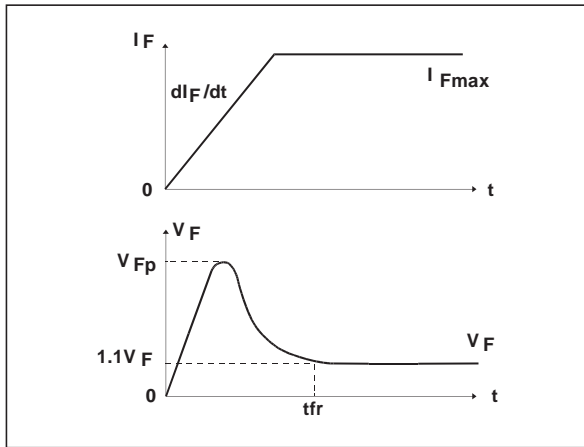

Turn-off losses (in the diode) :

$$P3 = \frac{V_R \times I_{RM}^2 \times S \times F}{6 \times dI_F/dt}$$

P3 and P5 are suitable for power MOSFET and IGBT

Turn-on losses :

$$P4 = 0.4 (V_{FP} - V_F) \times I_{Fmax} \times t_{fr} \times F$$
