

VIPAC™ Family of Power Systems 50 to 900 Watt

Description & Installation Guide

Product Description

Vicor's VIPAC is a new type of integrated power system leveraging the latest advances in DC-DC converter technology and modular front-ends. VIPAC combines application specific power processing units (PPU), a choice of chassis styles and remotely located hold-up capacitors to provide fast, flexible and highly reliable power solutions for a wide range of demanding applications.

The PPU is the core element of the system and may be specified for 115/230 Vac operation. The PPU incorporates Vicor's autoranging FARM modular front-end to provide transient protection, EMI filtering and inrush current limiting. The web-based **PowerBench™** enables designers to configure the PPU with up to three independently regulated outputs having power levels from 50 to 500 W and with as much as 900 W total output power.

(continued)

Product Description cont.

Vicor's Maxi, Mini, Micro Family DC-DC converters, in industry standard quarter, half and full brick packages, are used to deliver output voltages from 2 to 48 Vdc. Additionally, the wide trim range of the modules can provide operating voltages as low as 500 mV.

The PPU is comprised of:

- AC input modular front-end
- Vicor's Maxi, Mini, Micro Family, high density DC-DC converters
- Coldplate or finned chassis
- User interface
- Choice of output termination styles

The *VIPAC* is offered in several chassis configurations facilitating its use in a variety of applications using either conduction, convection or forced convection cooling. The low profile, conduction cooled version may be mounted to an existing cabinet wall, coldplate or heat sink. The 0.5" or 1" finned versions, available in longitudinal or transverse configurations, are ideal for use in free or forced convection environments.

VIPACs use remotely located capacitors to facilitate packaging and placement options not previously available. The low profile PPU can be placed closer to the load or attached to cabinet walls while the capacitors may be integrated into the host system away from heat sources for improved reliability. System hold-up / ride-thru requirements can also be tailored for specific applications via different value capacitors. The hold-up capacitors may be obtained from Vicor as a prepackaged hold-up box (HUB). *VIPAC* is a new class of flexible, high density power solutions.

Overview

The front-end section utilizes Vicor's FARM input module to provide EMI filtering, transient protection, inrush current limiting and rectification. The front-end also contains input connectors, fusing and control circuitry to which the user can interface with discrete circuitry. Up to three individually fused Vicor Maxi, Mini, Micro DC-DC converter modules are combined with the front-end in an integrated mechanical assembly providing a high efficiency power supply delivering up to 900 W of output power.

Application Tips

Remote Sense

A remote sense feature is provided on outputs configured with Mini or Maxi sized DC-DC converters. The output sense connections **must** be terminated either locally or remotely and may not be left open. VIPACs provided with the optional LugMate connectors are configured for local sensing via removable jumpers installed at the factory. The jumpers will need to be removed if access to the secondary control function is made via mating connector 16385 and connections will need to be established for local or remote sensing.

Hold-up Capacitors

Hold-up capacitors can be located remotely with up to 3' of cable. Vicor applications engineering should be consulted for projects requiring greater separation.

Wire Routing

Avoid routing wires over the VIPAC Power System.

Do not bundle Input and Output leads together.

Crimping Tool

Amp Hand Tool P/N	Die Set #	Wire Size
91508-1		20-18 AWG
91506-1		16-14 AWG
69710-1	58380-1	12 AWG
	58380-2	10 AWG

Parallel Outputs

The VIPAC can be configured with parallel modules for increased power or redundancy. When output terminations other than the LugMate are specified the user must properly connect the output and sense terminals. At no time operate a paralleled output with a load applied to only one module! (See Output Connection Options)

Input Connections

Maximum cable length between the HUB and VIPAC $\leq 3'$

*In the event of interference when connecting to the HUB, please remove the unused strain relief tab on the connector.

	J4-5	+ Vout	
5		+ Vout	

*Removable jumper is factory installed for local sensing. See Pg 5 for details

Output Connection Options

Please Note:

VIPACs that contain multiple modules configured as a single output (paralleled for power or redundancy) **MUST** have their Outputs and Sense connected to each other at the load. **DO NOT OPERATE A PARALLEL CONFIGURATION WITH ONLY ONE MODULE CONNECTED.**
